

ENGINEERING CONTINUITY PACK

GMS Catalogue Platform Development Handoff

Current implementation state, verified work, operational cautions, and the next safe actions for the receiving engineer.

TRANSFER STATE	BRANCH	HEAD
HANDED OFF	master	74a20ca

Important: the working tree contains mixed, uncommitted source changes and runtime artifacts.
Preserve it until ownership and release scope are confirmed.

Prepared: 21 September 2026 · Asia/Bangkok

Goal

Deliver the catalogue redesign requested in the current worktree while keeping the public/internal catalogue responsive and ERP-backed.

Done

- Replaced catalogue product cards with the clean reference template and removed legacy card styling/data presentation.
- Added responsive vertical grids: five columns on desktop, three at 1024 px, two at 768 px, and one on mobile.
- Changed automatic product-image rotation from three seconds to five seconds.
- Mapped card prices from synchronized ERP price levels: **SP6** to Wholesale, **SRP** to Online, and **SP5** to Retail.
- Category selection now renders only the selected category; search is scoped to that category and includes a clear control.
- Removed the category order badge and imported-description line from catalogue section headers.
- Removed the redundant Catalogue price mapping tab while retaining access to both mapping and ERP matrix views.
- Mobile header now uses an icon-only category control, search, and EN/Thai controls on one line. PDF and Print are hidden on mobile.
- Latest change: mobile search consumes the flexible header space (about 210–230 px at a 400 px viewport) and contracts without horizontal overflow at 320 px.

Files

- Backend ERP card prices: `backend/app/commerce.py`, `backend/app/commerce_schemas.py`, `backend/app/catalogue_share_links.py`, `backend/tests/smoke_catalogue_share_links.py`.
- Product-card template: `frontend/src/components/catalogue-product-card.tsx`, `frontend/src/components/catalogue-product-card.module.css`, and tests.
- Category/search/mobile navigation: `frontend/src/components/catalogue-sidebar.tsx`, `frontend/src/components/catalogue-sidebar.module.css`, public and internal preview viewers, and tests.
- Price-management tab: `frontend/src/app/dashboard/price-management.tsx` and its test.
- API/types/translations: `frontend/src/lib/api.ts`, `frontend/src/lib/i18n.tsx`, `frontend/src/lib/management-translations.ts`.

Worktree

- Branch: `master`; HEAD: `74a20ca` (tth).
- The tree is intentionally uncommitted and contains many source changes plus generated/cache/upload changes predating the final mobile-search adjustment.
- No commit was made because the tree mixes multiple user-requested changes and runtime artifacts.

Verified

- `npm.cmd test -- --run src/components/catalogue-sidebar.test.tsx`: passed, 11/11 tests.

- Targeted Playwright mobile-header test: passed, 1/1 at 400, 320, and 1440 px checks.
- ESLint on the sidebar component/test and targeted Playwright spec: passed.
- `git diff --check` on the latest sidebar CSS/spec change: passed (line-ending warnings only).
- Updated render: `C:\Users\GMS\AppData\Local\Temp\gms-catalogue-mobile-header-search-400.png`.
- Full frontend suite, production build, and backend suite were not rerun at this handoff.

Deviations

- The exact reference card intentionally ignores saved legacy card themes/appearances, per user instruction.
- ERP prices are read from synchronized local ERP price tables, not queried directly from SQL Server during each catalogue request.

Environment

- Intended development commands are `scripts\start-frontend.ps1 -Foreground` and `scripts\start-backend.ps1 -Foreground`.
- Service processes were not checked at handoff time.
- `frontend/.env.local` routes API traffic through `/api`.
- Ngrok has been removed from the active configuration. `PUBLIC_APP_URL` now uses `http://172.16.1.94:3000`, with matching LAN and localhost CORS/Next.js origins. Restart both services after any origin change.
- Do not copy credentials from chat history or `.env` files into code.

Risks

- `Intransit / Order` currently reads optional product-detail fields and falls back to an em dash; the actual ERP purchase-order/container integration is still pending.
- A full regression/build pass is still required before release.
- Deleted and newly generated files under `backend/.cache/catalogue-pdfs/` and new files under `backend/private_uploads/catalogue-covers/` require owner confirmation before cleanup or commit.

Turn State

- State: handed-off
- Last move: baton-pass
- Last agent: /root
- Next agent: next Codex session or engineer
- Updated: 2026-09-21 20:02:56 +07:00

Next

1. Run a minimal foresight check: compare this note with `git status`, the named source files, and the latest commit.
2. Confirm whether the next priority is ERP `Intransit / Order` integration or preparing the accumulated catalogue changes for commit/release.
3. For ERP purchase orders, implement separate `in_transit` and `ordered` quantities, where in-transit means shipped/container-dispatched and ordered means placed but not shipped; expose the display as `in_transit / ordered`.
4. Run the relevant backend smoke tests, frontend component tests, Playwright grid/mobile tests, and a production build.
5. Review generated cache/upload changes separately; do not bundle them into a source commit without approval.

Immediate UI continuation

The last requested mobile-search-size change is complete. If revisiting it, start at `frontend/src/components/catalogue-sidebar.module.css` and the test beginning near line 67 of `frontend/e2e/overlap/catalogue-sidebar-render.spec.ts`.

Repository safeguards

- Workspace: `C:\Project GMS\catalogue-main`; branch: `master`.
- Preserve the dirty working tree. Do not reset, restore, delete, or commit unrelated files without the user's explicit direction.
- Treat generated PDF-cache changes and uploaded catalogue-cover files as user/runtime data until their ownership is confirmed.
- Never place ERP/database credentials in source, tests, logs, screenshots, or handoff notes. Existing `.env` files are local and must remain uncommitted.
- Use `apply_patch` for source edits and run focused tests before broader verification.
- Frontend development port is `3000`; backend development port is `8001`; frontend API requests use the `/api` proxy.
- Read `docs/current-state.md` and `docs/next-task.md` before making changes.
